

Testing

ecadia™ learning management

Multilingualism

The question pool can be created in several languages and each participant can choose the language of his/her own test.

Start the test with a participation code

Perfect logistics

The tests of the participants are embedded in courses. In this way, the entire correspondence and logistic processing takes place in the proven form.

Successful tests automatically result in the corresponding update in the employee's qualification overview.

ecadia Testing

perfect integration of testing into the course and qualification planning

Build a question pool that generates individual tests for your participants.

The most common types of questions are available:

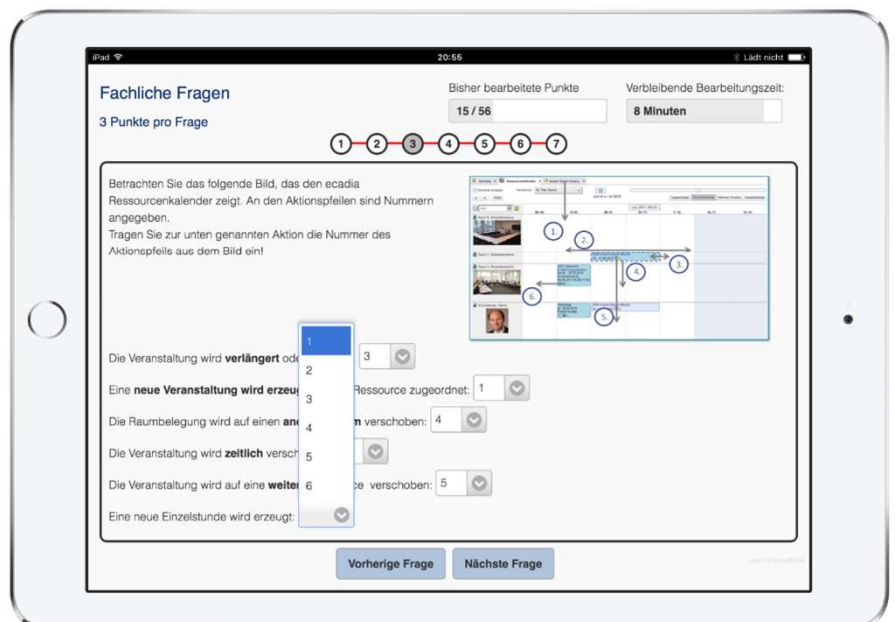

- Single selection
- Multiple choice
- Gap text with free text input or selection
- Set order by drag & drop
- Assign pictures to terms

The tests can be performed on desktop computers as well as on tablets.

Individual tests using test templates

A test template is based on one or more question folders of the question pool. The test duration and the minimum score are set.

A random selection of questions for the test is automatically created for the participants. The evaluation is also automatic.

The test results are always transparent

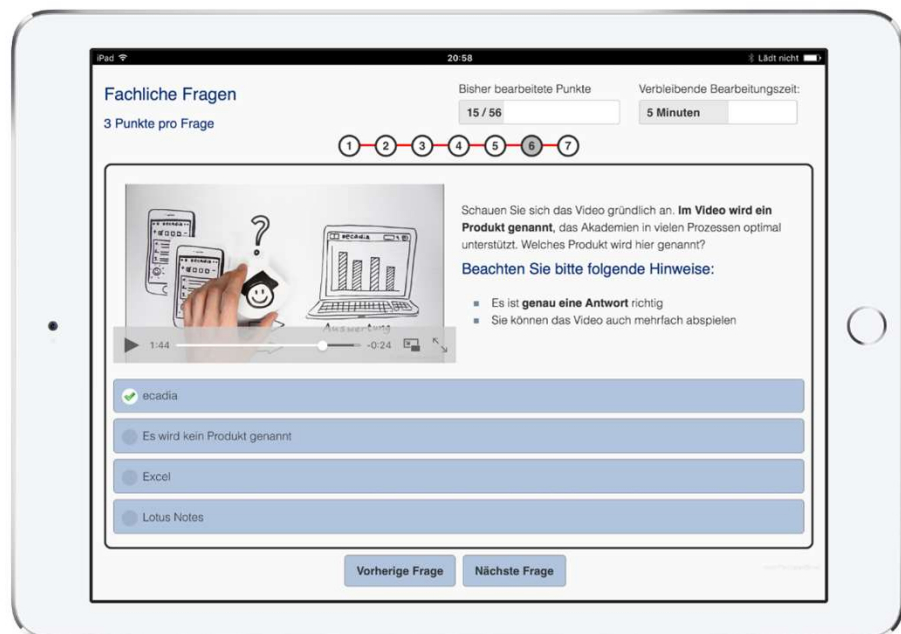

The organizer always has an overview of the completed tests and the results. In special cases, it is also possible to intervene manually after the automatic correction.

Also, with each conclusion of a test, a revision-proof PDF document of the test is generated.

The organizer has the overview of the test results of the participants

Video Integration

Should a video be integrated into the question? No problem, because all types of questions can be easily combined with videos.

Proven ecadia operation

All functions of the testing are fully integrated in ecadia and are operated and configured in the usual way.
